PRESS RELEASE

September 27, 2004

setcom offers the world's first GCF validated MMS test cases:

The new SCAT 5020 test platform in conjunction with Agilent's RF unit TS8960 is the first product worldwide to offer a GCF-validated set of MMS 1.2/1.1/1.0 compatible test cases. This new platform (TP41) was demonstrated and approved at the GCF meeting in Rome this month.

In this context, Agilent Technologies Inc. is pleased to be associated with setcom in being first to market and thus helping bring conformance tests to MMS, as Agilent has announced on September 20, 2004.

The setcom Comprehensive Applications Tester S-CAT 5020:

The "setcom Comprehensive Applications Tester" (S-CAT 5020) is a powerful tool for developing, testing, and debugging mobile terminal applications like **MMS, eMail, DRM, PoC, IMPS, video call** and other future services.

Hardware-Independence:

The system is truly hardware-independent. It can be set up with virtually any RF unit, connected to real or test networks and may even be used for software-only simulated testing. Necessary adaptations are simply accomplished by designing appropriate drivers for the specific needs of the customer.

setcom wireless products and services:

setcom develops cutting-edge technologies for test solutions that can be applied not only in conformance testing, but also product development. Therefore, setcom significantly helps shortening customer's development cycle and time-to-market.

For more information on the S-CAT 5020, please visit us at www.setcom.de.
